

Design Document:

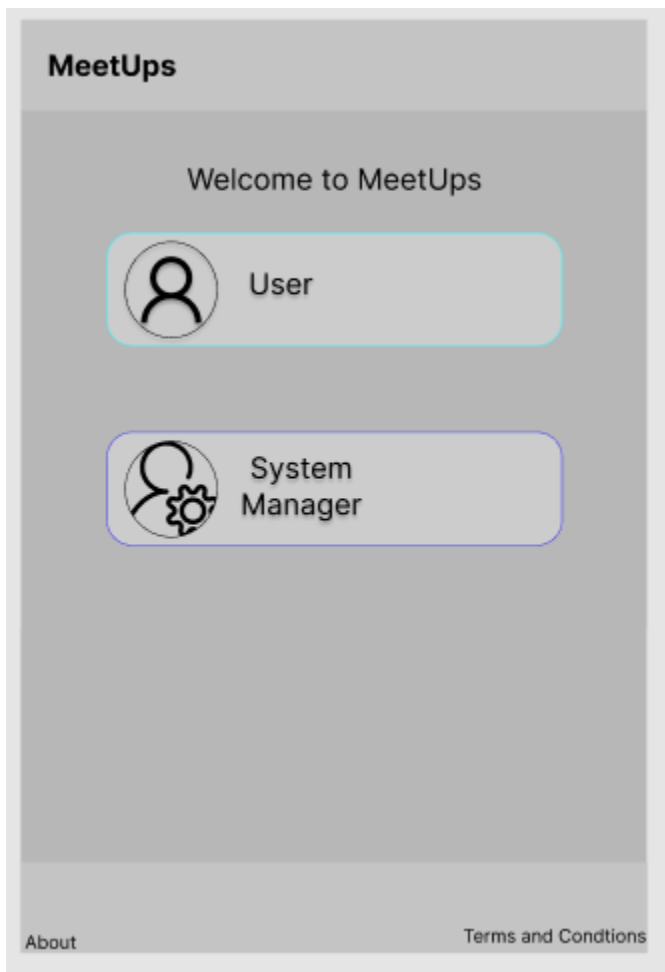

Some clarifications:

- Where font-size is not specified, use font-size that matches the image above it. What is meant by that is use a font-size that replicates the design image and is as close as possible to the dimensions that make up that design image.
- The images provided for the design are 90% accurate (subject to changes when implementation comes around) and hence should be used as reference first and then the description for elements should be used if things are not clear and clarification is needed for what element is what exactly.
- Where color is not specified, use image as reference for color to be used.
- Anything that is not specified in the notes for the image provided, just look at the design image and use whatever is as close as possible to matching the design image provided.

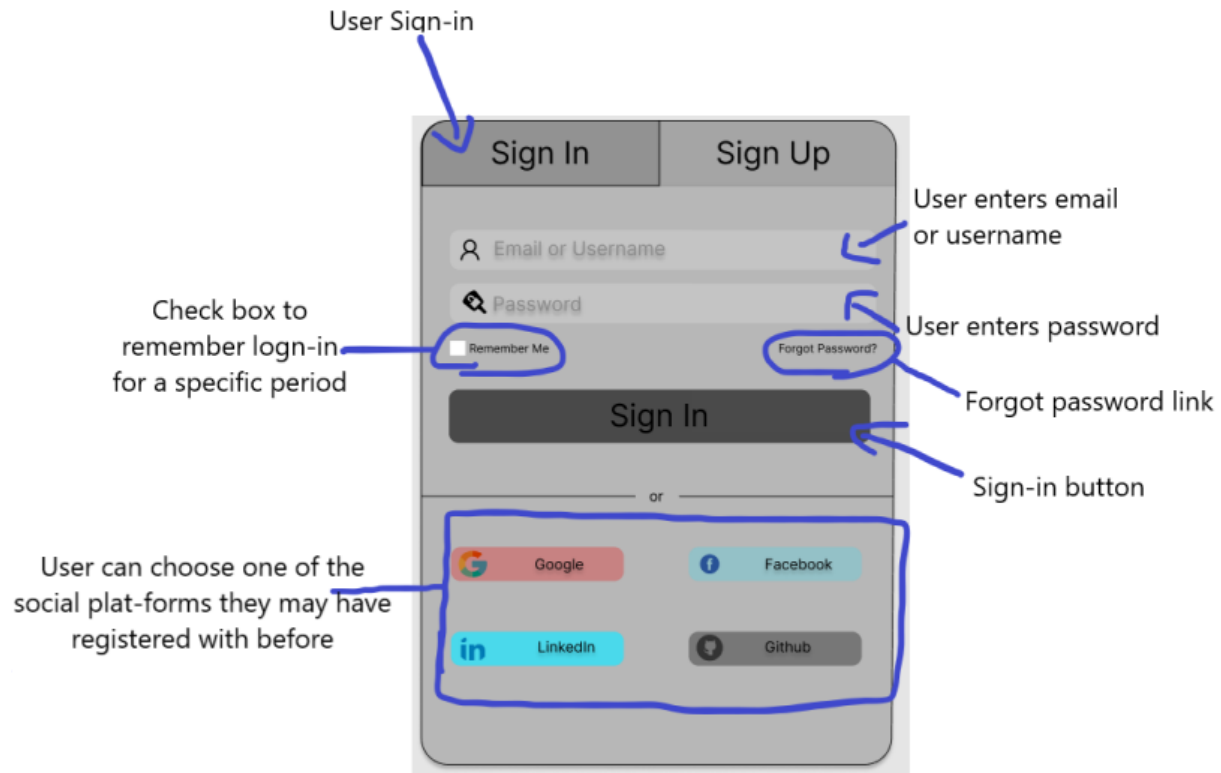

- First page user sees when they go to the website
- Has welcome message right at the top middle.

- Below it is two buttons with the names “User” and “System Manager” in black with a different shade of gray background compared to the background of the actual button (look at image and compare). Both of these items will be in a container which will have enough padding to make these items be in the middle of the page.
- Page should resize properly and elements should change size with the browser
- Highlighted/hovered button will have a green-ish outline/border
- Color scheme on the page used is gray, different shades of gray, black and green (for hovering).
- Both buttons are close together to reduce kinematic load between them and they’re placed right in the middle with no content to look at on the sides of them at the same height, so user’s eyes go directly to the middle where these items are.
- Right at the bottom of the page, on the left and right are the links/buttons to the About page and Terms and Conditions page. They’re both spaced equally from the

- Mobile version of this page is not very different. Only real difference is the placement of the two “User” and “System Manager” Sign-up/Sign-in buttons. Rather than being aligned next to each other horizontally, now one is above the other with some distance

between them to avoid user accidentally clicking the wrong button. This reduces user frustration.

- This is the Sign In box. A user enters their email or username that they have registered with and then the password associated with that.
- User can click on Forgot Password which will send a reset password link to their email.
- Remember me checkbox remembers the user's log-in for a specific period of time
- After the "or" in the middle, the user can select a plat-form that they might have registered with when they signed up to the website.
- The color scheme is grey and black with different shades of grey through-out.
- Colors of the links of other plat-forms are changed to colors that are associated with those certain plat-forms. This is for making that section visually easier.
- Everything is inside of a box, clear and compact. This does not take up the whole page but rather this box is in the middle of the page with all of these other elements within it.
- Takes up about 50% of the page in the middle and the rest of the page around this login container is going to be the gray background of the page.
- Elements are not fixed in size and resizing the window will make them shrink or change size.

Sign-up link

Sign In Sign Up

N First Name

L Last Name

Phone Number

Gender

Activities

Email or Username

Password

Google Facebook

LinkedIn Github

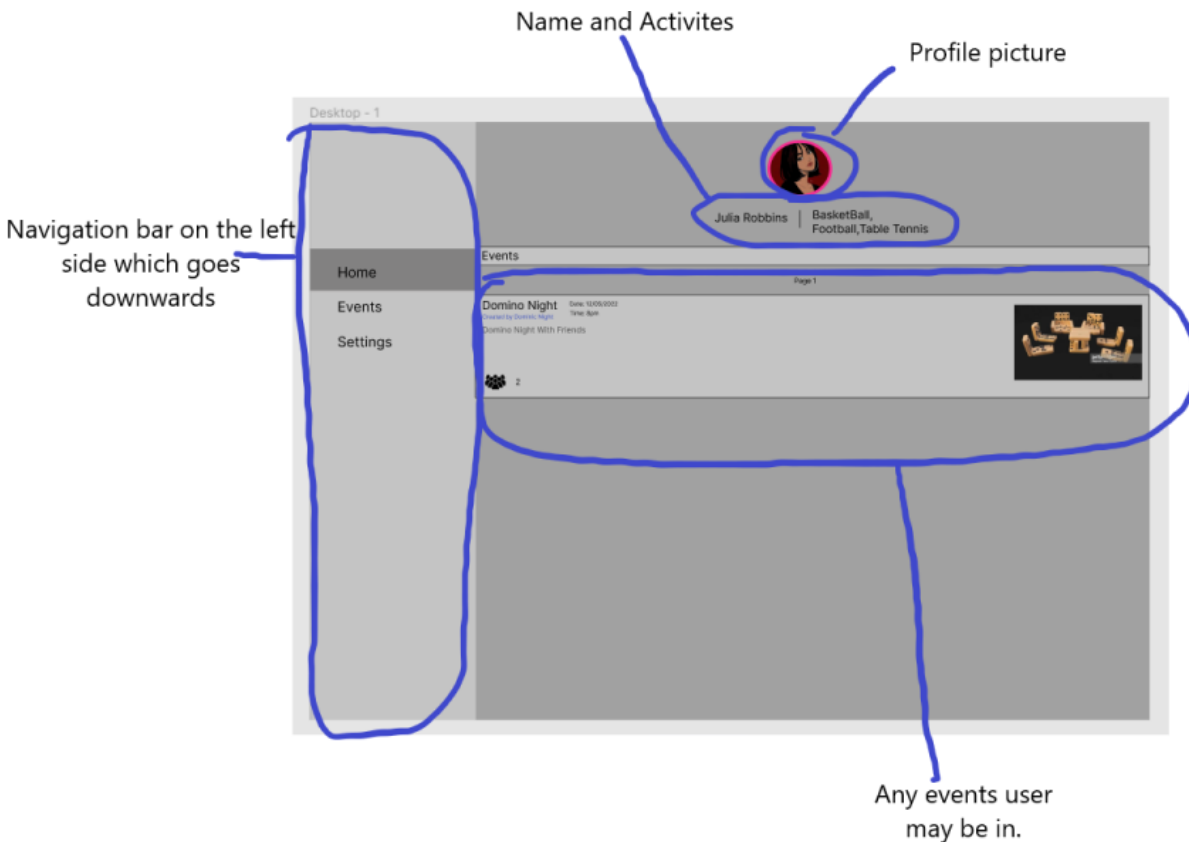

User fills out information to sign-up

Each of these sections are rows for different information and Gender is a drop down box

Register using a different plat-form

- Sign-up box. The same as the Sign-in box but the user has to fill in every bit of information here to register an account with the website
- Activities and Phone Number could be left blank if user does not want to provide that information.
- On the bottom we have links to register with different plat-forms
- Colors used are the same through-out. Gray, black and different shades of gray. Links to other plat-forms have colors that match the plat-form's staple color.
- Everything is close together and compact. Nothing is out of place and everything is written clearly and visibly.
- Takes up about 50% of the page in the middle and same as above.

- Elements are not fixed in size and resizing the window will make them shrink or change size.

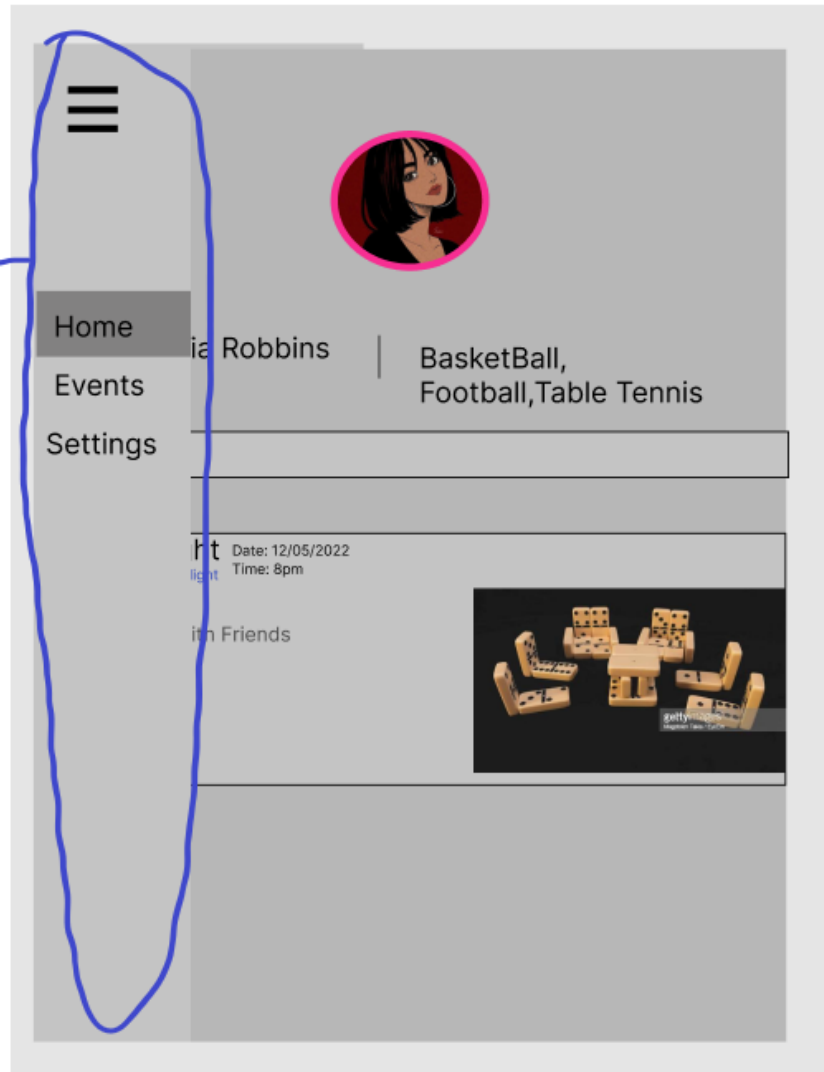

- Home page after user has logged-in as a non-administrator.
- 25% of the page on the left is the navigation bar with links to the Home, Events and Settings pages.
- 75% of the page is the main display of the page, in this case "Home"
- Shows user's profile picture at the top middle and below it, it shows the User's name and any activities that they might have inputted.
- Below this, there's a drop-down box that lets them see a specific item, in this case it's their events
- Below the drop-down box, all the things related to the category are displayed in rectangles, which will have overview information about the category and may/may not have images.
- Color scheme used is Gray, black and other shades of gray.
- Navigation bar links are close together.
- Elements are not fixed in size and resizing the window will make them shrink or change size, rather they will just appear to the extent of how much a user can view them. It will be like this for all pages on the website and hence this point will not be mentioned anymore.

Menu to open navigation bar

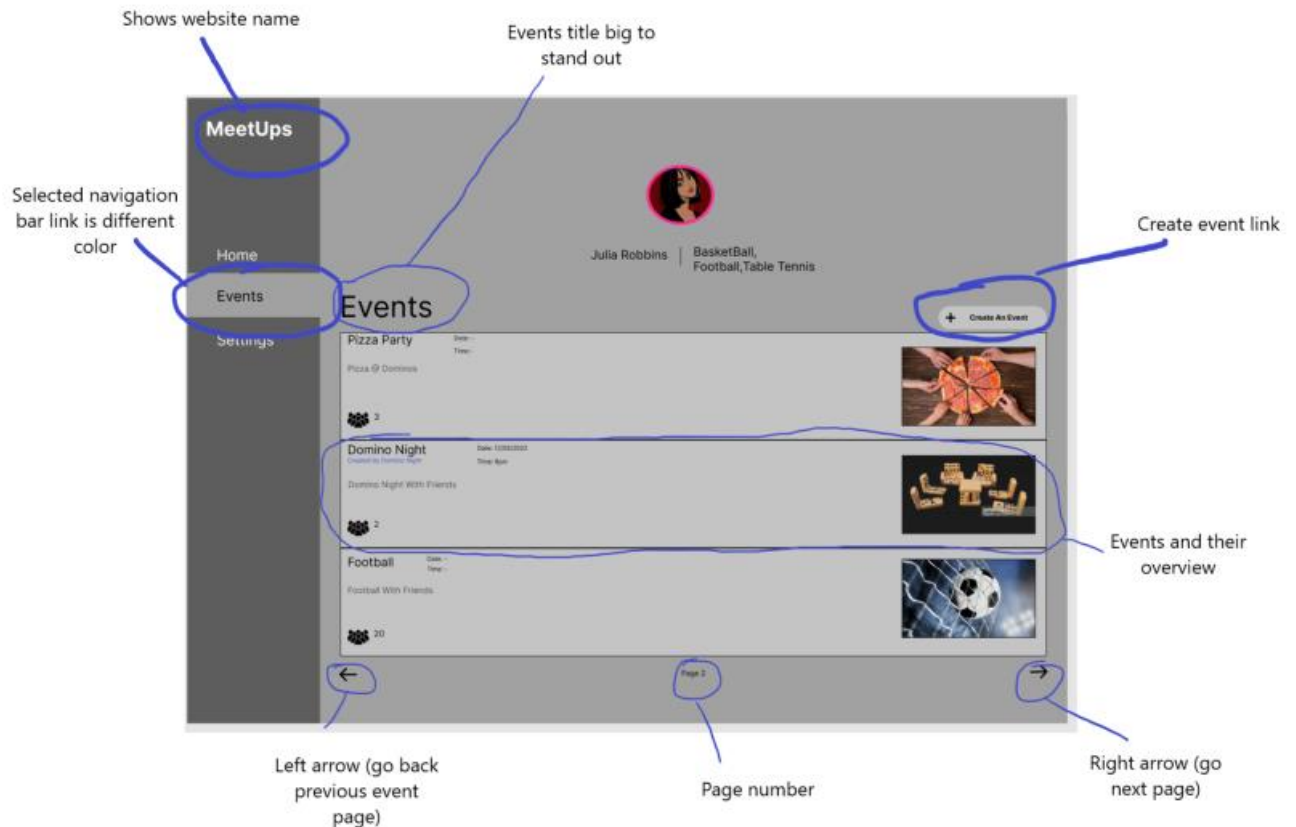

- Main page after log-in is the same on the phone but instead of having the navigation bar on the left all the time, the user has to click on the menu icon at the top left to open the navigation bar.

Navigation bar
opens up and
slides to the right.

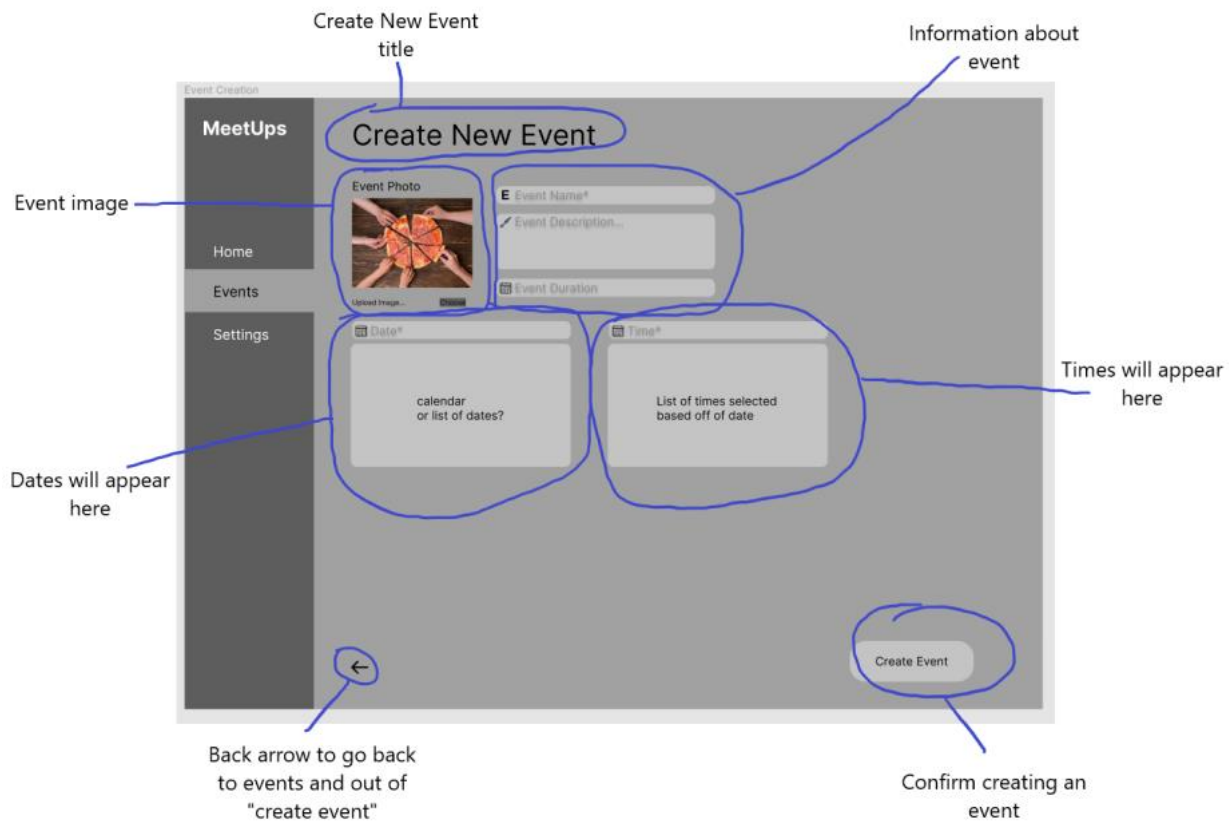

- The navigation bar will go over the page behind it, making anything in the place of the navigation bar disappear behind it.
- The navigation bar from here is the same as the desktop version.
- All colors are the same as the desktop version.
- What may be seen on the phone may be a little closer together and smaller in size relatively compared to the desktop version.

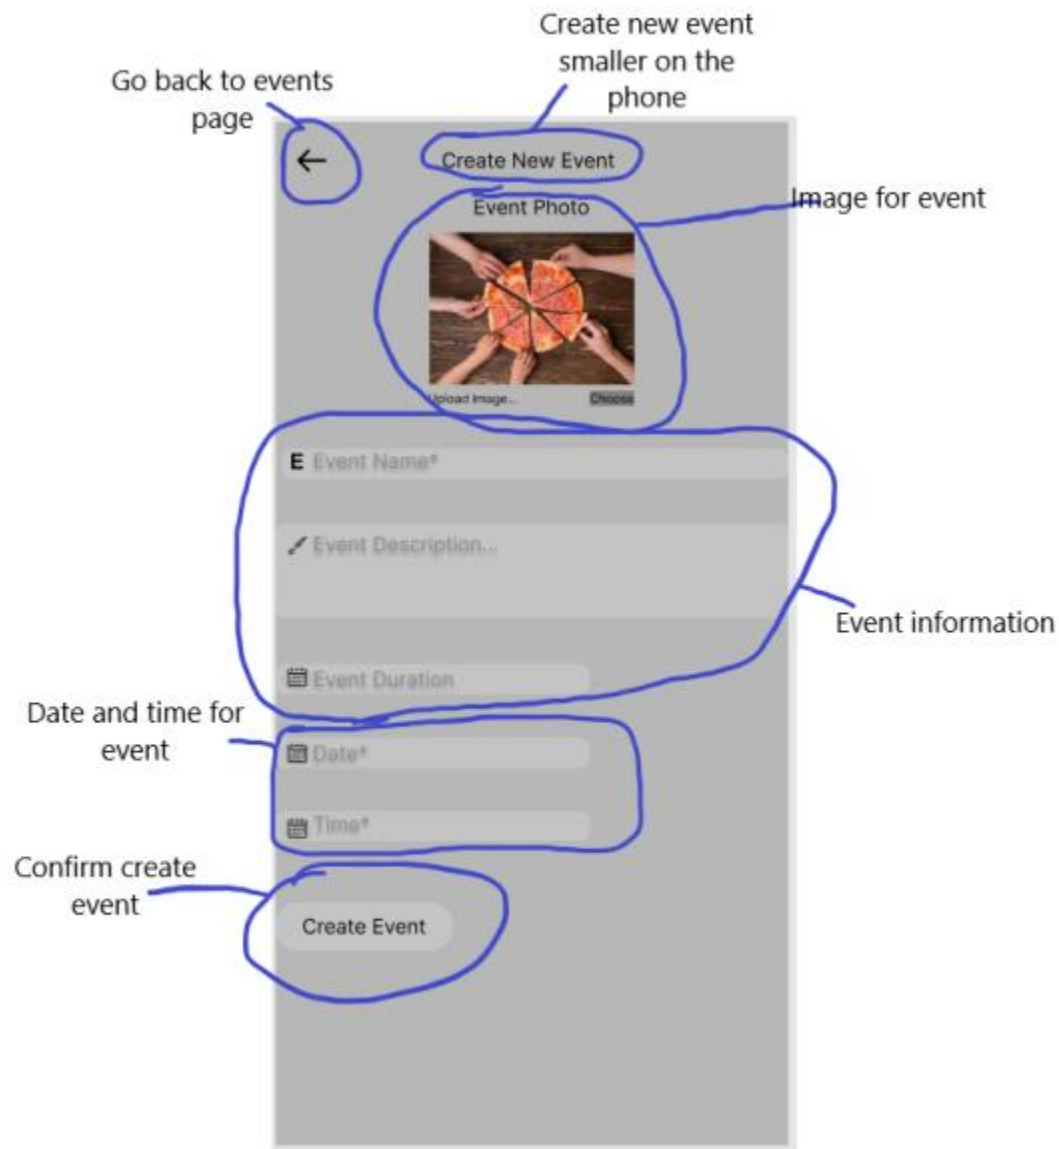

- Top left of the navigation bar contains the website name in white (new color added).
- On the left the link items are in the color white but the selected one turns to black and the shade of gray around it changes to a light shade.
- This is different to the images above as after a small review, we decided to change the colors of the items in the navigation bar and make it seem more apparent on which item is selected and make it look a bit better, too.
- The profile picture, name and activities stay the same as above.
- Events title on the left (to the right of the navigation bar border), which is bigger than all items and is more “in your face” to get the message across. This will be in black.
- Create event link in oblong shape with “+” inside of it to make it visually easier to identify what it may do. Oblong background in lighter shade of gray and the contents above that in black.
- Individual “event” rectangles that take up most of the page’s 75% right side with space left at the bottom of the last event for the other elements and some margin on the right and left side.

- Left and right arrows at the sides of the page to indicate to the user that they can shuffle between pages and a page number at the middle of both of the arrows. All of these elements are in black.

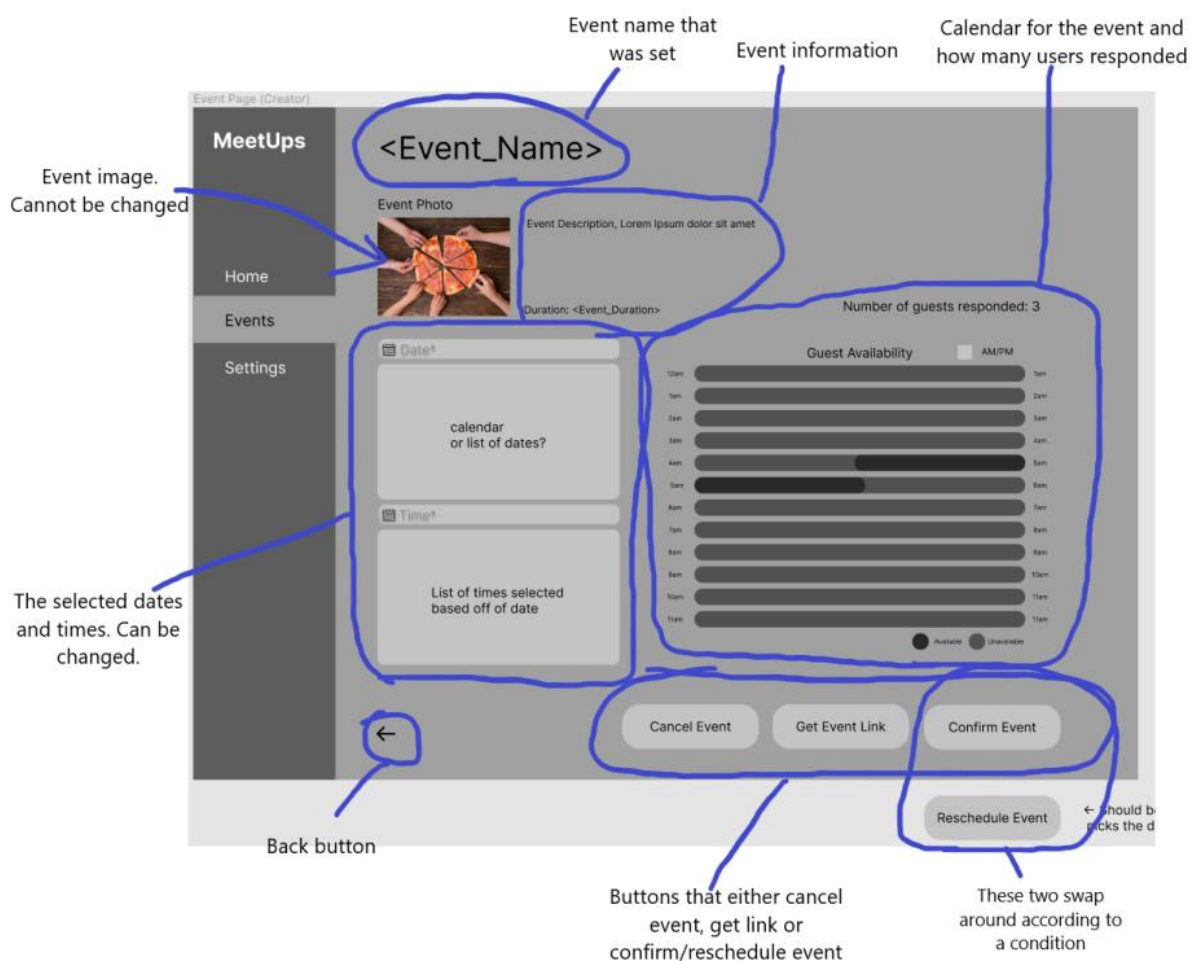

- This is the page that appears when a user wants to create an event.
- “Create New Event” in your face and bigger than everything. In color black. On the left side of the 75% of the page that is given to the right side of the 25% of the navigation bar.
- Below it there will be an “Event Photo” small title which will allow user to add a photo for the event. The photo will be resized to match the dimensions of the shown area (may be scaled down or up).
- On the right of the photo should be three text areas. Anything with the “*” in the placeholder needs to be filled. Event Description text area bigger than the other two text areas to show user that they may need to add more than one sentence.
- Below should be two rectangular elements that are for Dates and Times.
- All of these things mentioned above are close together and separated by a lot of small margins. This requires less effort from the user and reduces kinematic load.
- Back arrow at the bottom left to exit out of “Create New Event” to reduce “errors”.
- Oblong on the right bottom of the page to create the event.

- Both of the elements mentioned above are at the bottom of the page as that is where users usually would expect them to be from experience.
- Color scheme used is the same as the whole website; gray, other shades of gray, black and white.
- Observation: A lot of space is left in the page and that is okay. It is about making the create event process easier for the user rather than using up all of the page's space.

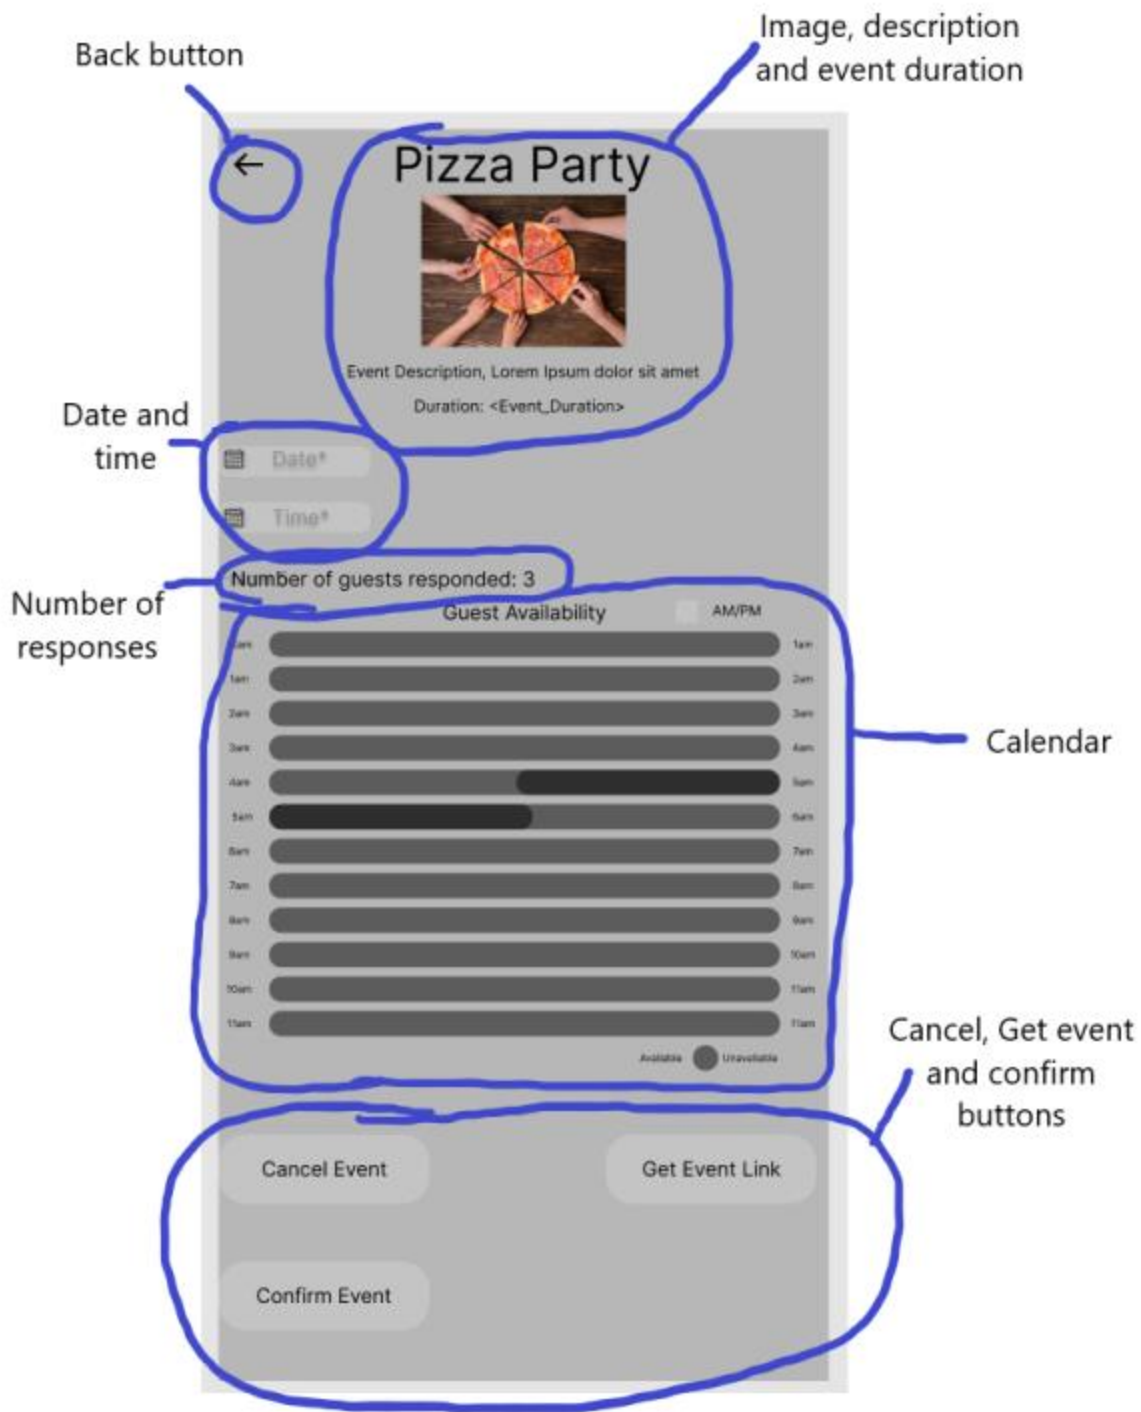

- The create event page has all of the same elements as the desktop version but they're more concise and smaller.
- Event information elements are relatively the same

- There's a go back arrow on the top left of the page which redirects user back to the event page.
- Date and Time elements are the same as the desktop version but they're much smaller with less information displayed.
- Create event button below everything on the left side instead of the right side.
- Everything is close together and compact with enough space in between elements so that users do not accidentally click other elements when they're trying to access another element (fingers being bigger than the distance between elements).
- Image chosen for the event will come from their phone gallery.
- Color scheme is the same as the desktop version.

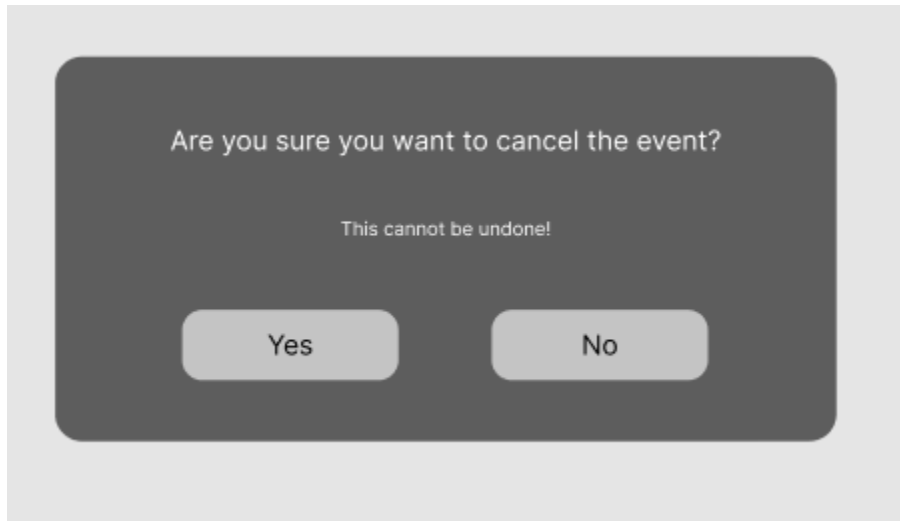

- Event name is the name that was set by the user when they created the event. It is the biggest item on the page in black.
- Below it is the set image and to the right is the event description and event duration which was set. These items are a bit smaller.

- Below the image and description are the selected dates and times. These are interactive and can be changed if allowed.
- Below the dates and times is the back button in the form of a back arrow.
- To the right of the back button on the same height are the three buttons that are "Cancel Event", "Get Event Link" and "Confirm Event" which switches with the "Reschedule Event" button depending on certain conditions. All of these buttons are the same dimensions.
- Above these buttons on the right is the calendar. The calendar in the image above is kind of like a placeholder or it may not be. That calendar may be replaced by a Google Calendar like Calendar but the size of it relative to the web page will be the same and above the Calendar will be the number of guests that have responded.

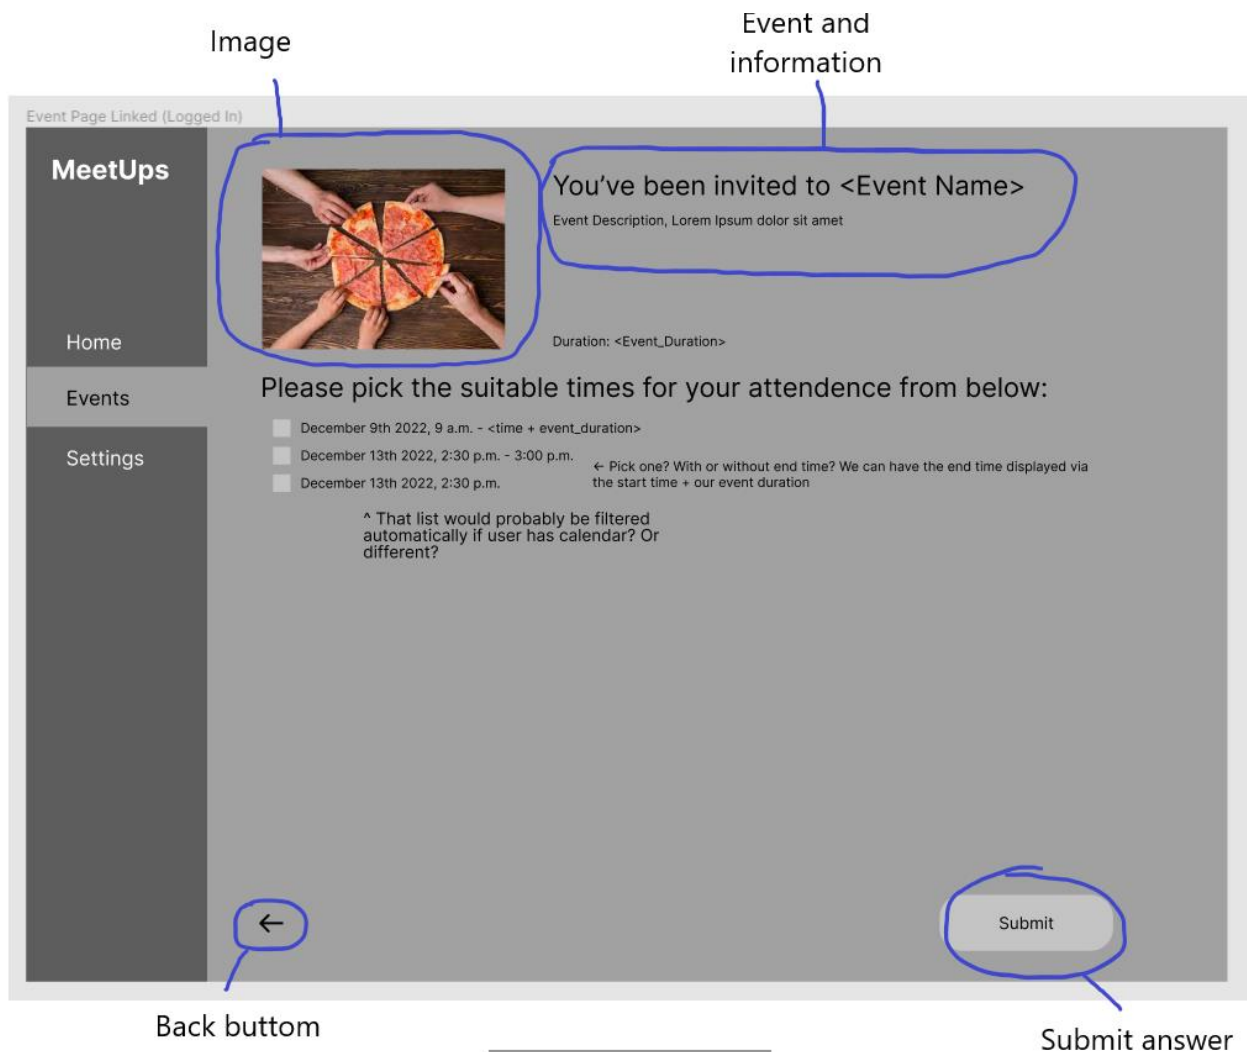

- Webpage on the phone uses the same color scheme and all of the elements used are the same but where they are positioned is different.
- Image, description and duration in the middle top of the screen

- Date and times on the left below the image and below these two elements are the number of responses.
- Below this is the Calendar which takes up all of the space from left to right and about 40-45% of the page height.
- Cancel, event link and Confirm event buttons at the bottom, spaced out quite a bit to avoid any accidental clicks.

- Cancelling an event should give the pop-up as shown above.

- This is the page a user gets when they click on an invite from another user to an event
- The user who has been invited must be logged into their account for this specific page to come up
- Event image on the top left accompanied by a message which is the biggest writing on the page which says “You’ve been invited to” and the event name and below it is the event description and duration of the event
- This message is big because the user should see clearly what this page is about and what is happening exactly.
- Below these items are where the user checks checkboxes for when they might be available.
- These checkboxes have a title above them which says “Please pick the suitable times for your attendance from below” and is bigger than the checkboxes because again, the user should know clearly what these checkboxes are for and their eyes should be able to read this properly and clearly.

- A lot of space is left in between the “Submit” button and the checkboxes. Related objects are close together and space is left because there is no need to equally space out these checkboxes throughout the page which would probably increase kinematic load. The checkboxes could be made bigger and spaced out more throughout the page to keep the kinematic load low and use up the space but then the point of bigger things being more important becomes less significant.
- On the bottom right of the page is the submit button. It is not too far to the right but not too far away from the right that it may be positioned in a place where the user may not expect the “submit” item to be which may cause them to learn the page a little more, thus increasing cognitive load.

Event Page Linked (Anonymous)

MeetUps

You've been invited to <Event Name>
Event Description, Lorem Ipsum dolor sit amet

Duration: <Event_Duration>

Please pick the suitable times for your attendance from below:

- ☐ December 9th 2022, 9 a.m. - <time + event_duration>
- ☐ December 13th 2022, 2:30 p.m. - 3:00 p.m.
- ☐ December 13th 2022, 2:30 p.m.

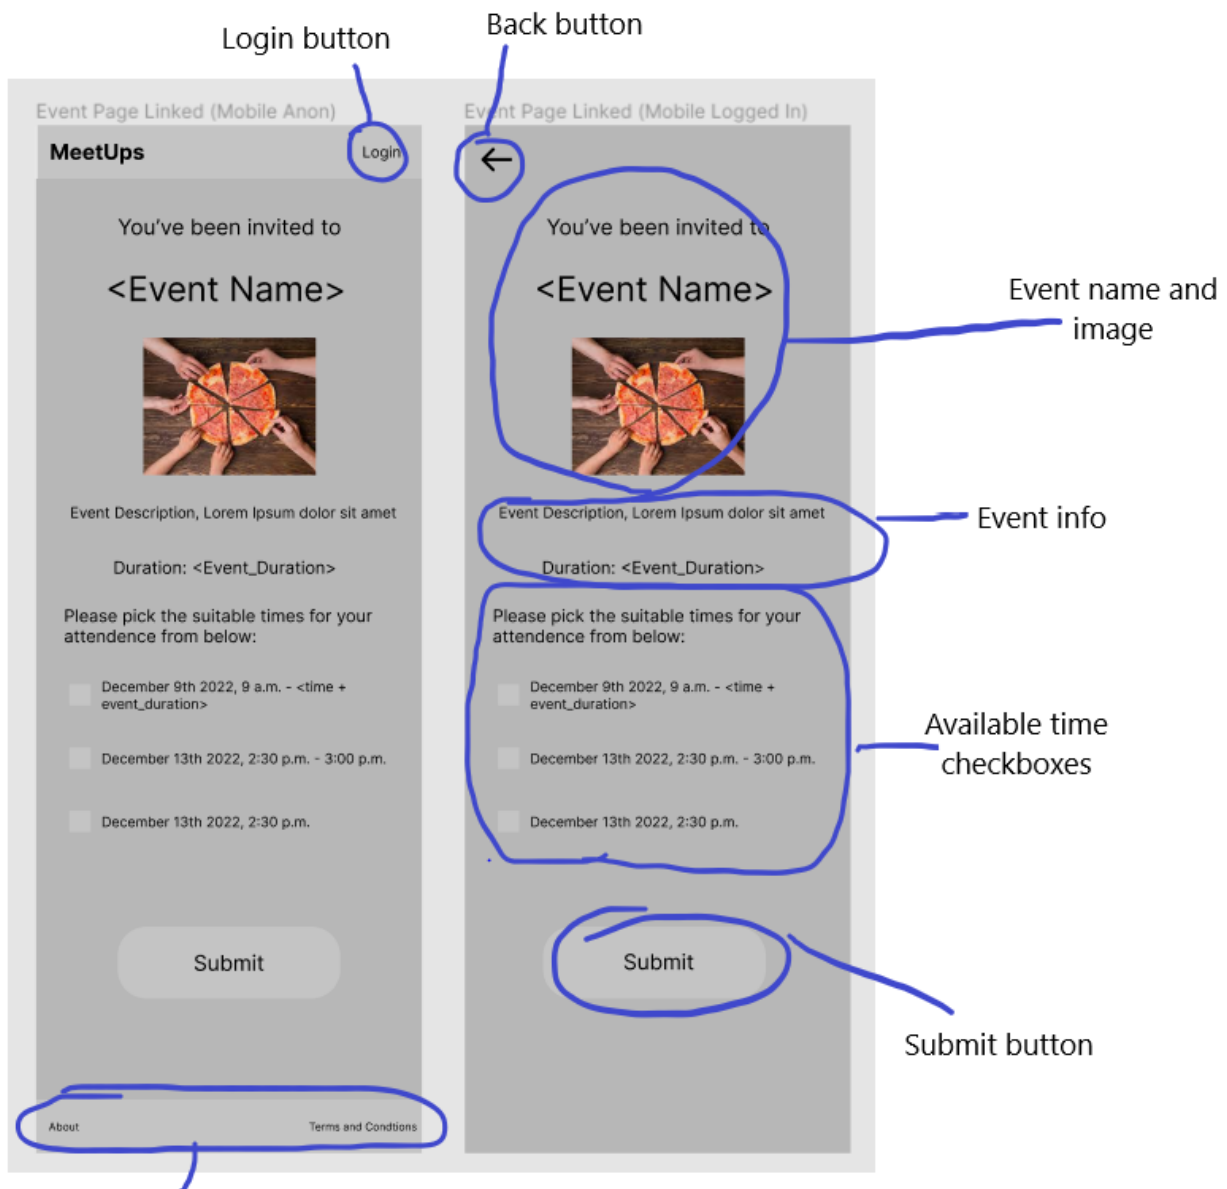

← Pick one? With or without end time? We can have the end time displayed via the start time + our event duration

Login and Submit buttons in the bottom middle

Login Submit

About Terms and Conditions

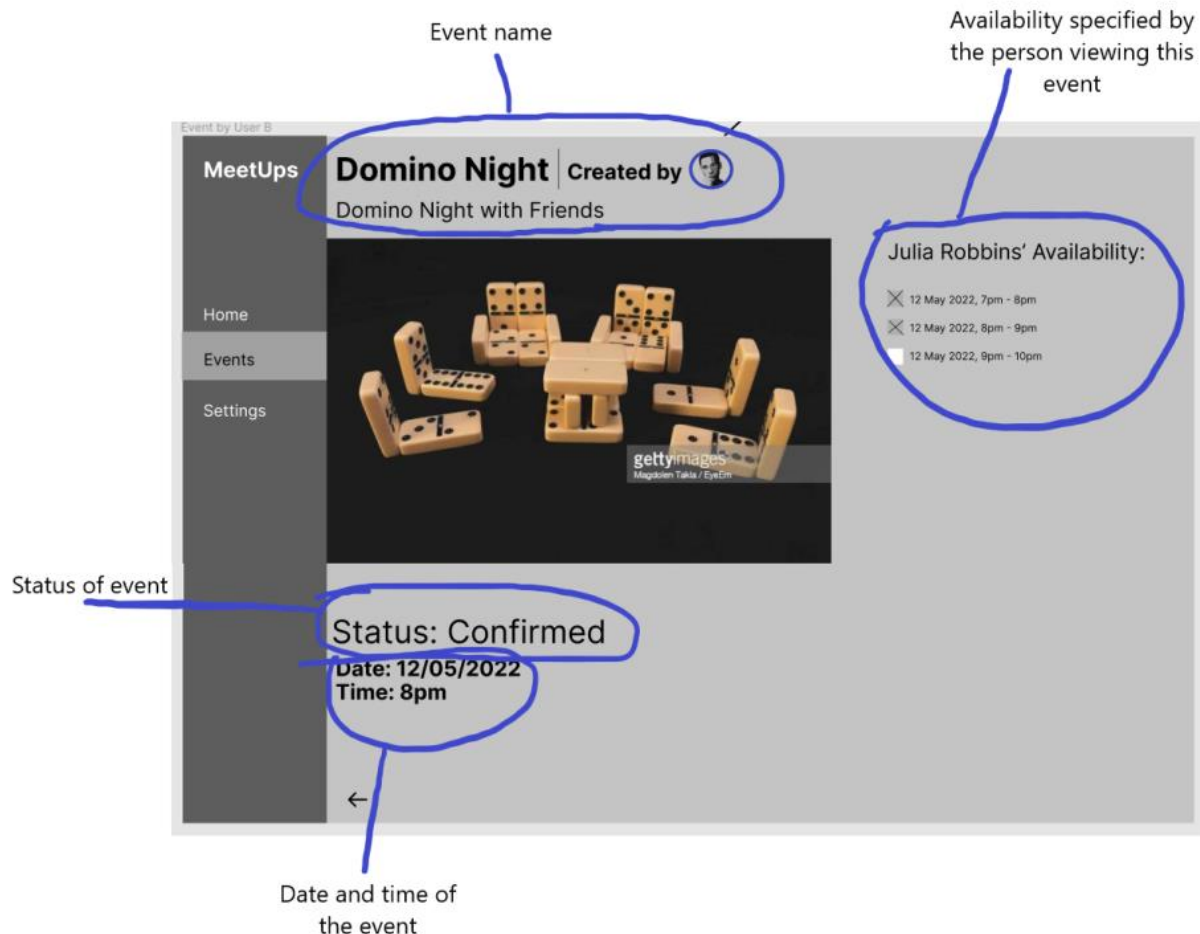

- This is the page that pops up if someone clicks on an invite from the host and the invitee does not have an account or has not logged in
- All elements are the same as above but this time, the buttons are in the middle bottom with the extra button “Login”
- There is no side navigation bar in this instance but maybe it can be added? (Something to check for in the review).

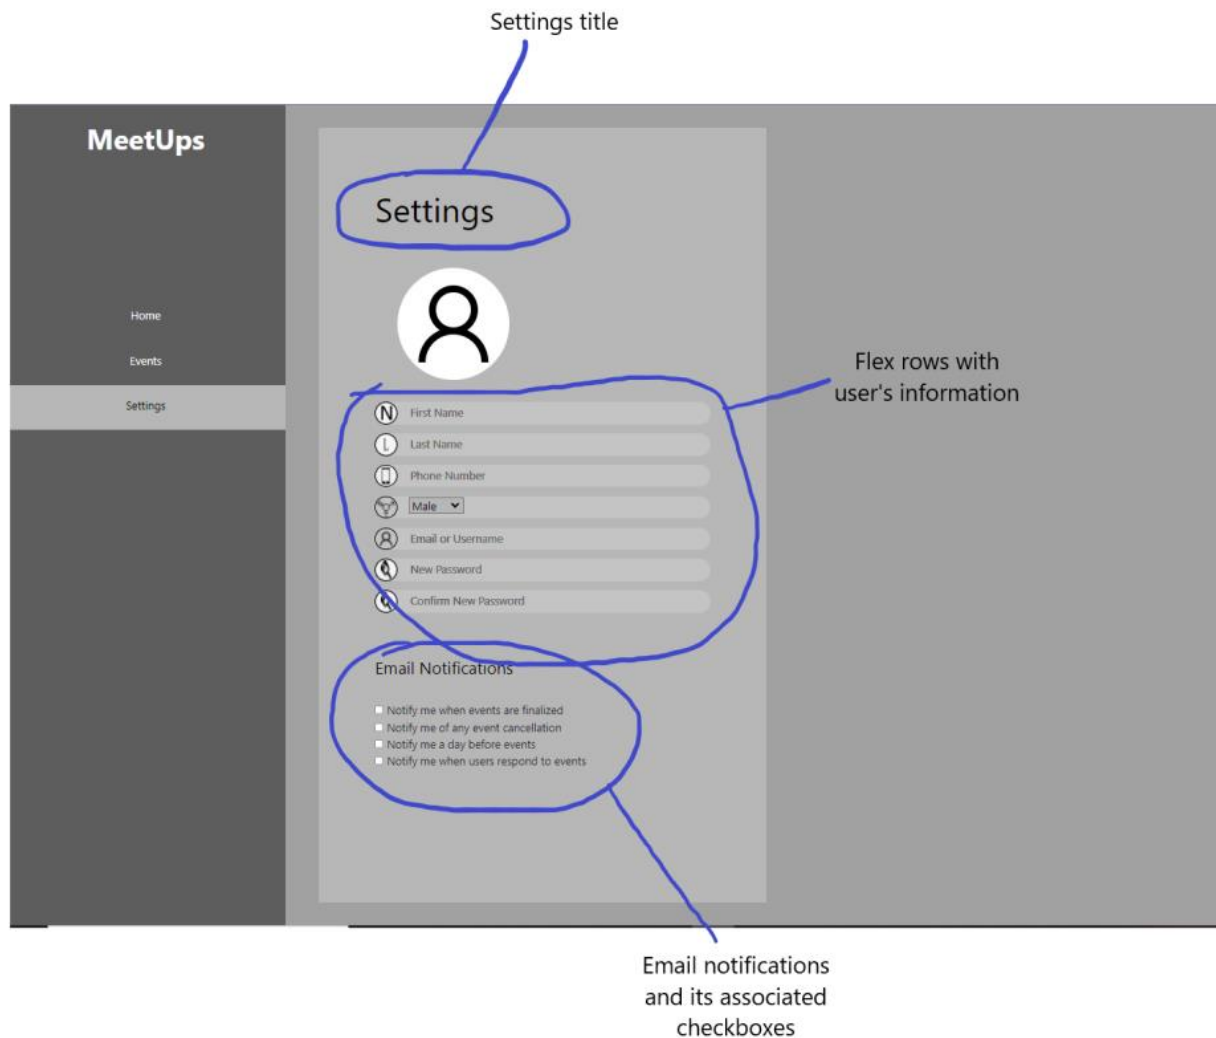

About and T&C

- Page for event invitation for the invitee on the phone. All elements are the same as the desktop versions except for a few changes.
- Everything is more compact.
- Submit button is relatively much bigger.
- Event name is in the middle of the page with the event image, event description and event duration right below it.
- Time checkboxes have a smaller title above them (something to look into after a review?)

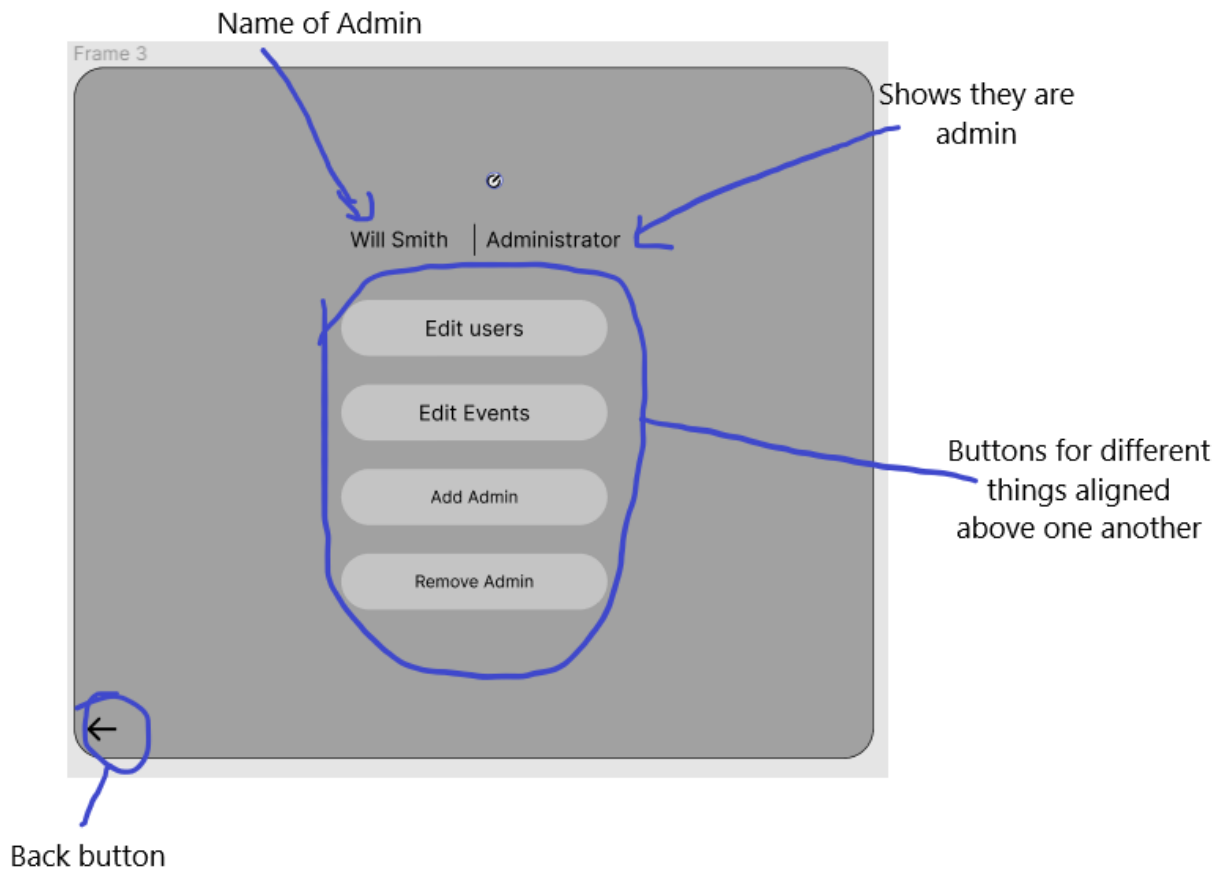

- On the non-logged in user page, the difference is that there is no back button, there's an about and terms and conditions at the bottom of the page and to the right top of the page, there is a login button.
- All the buttons are seemed to be placed in places users may expect them to be for example the login at the top right and the submit button right in the bottom middle.

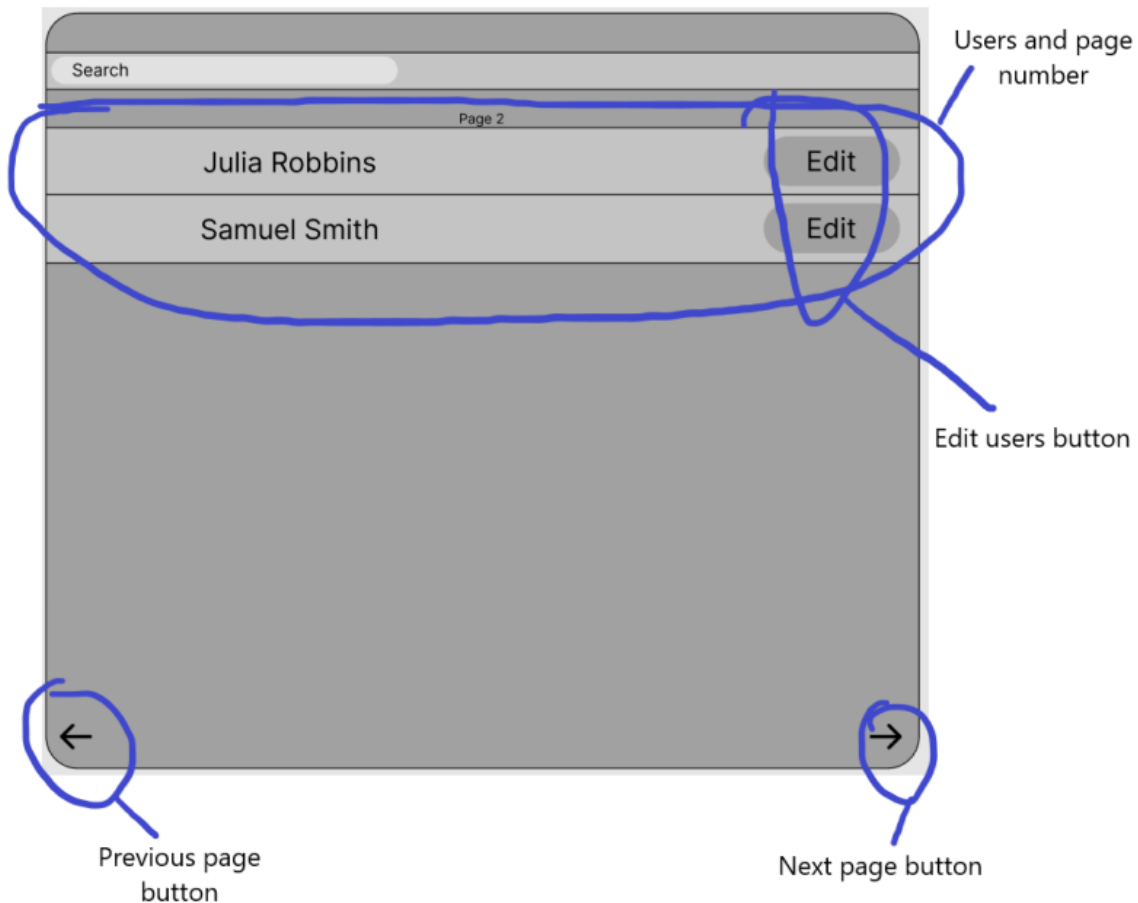

- This is the page the user sees when they're viewing an event that they have not created and have accepted an invite to. This is different to the pages above in the way that this will show the status of the event and the checked availabilities of the user.
- Top of the page on the left (but to the right of the navigation bar)
- User's availability selections are on the top right side with their name bigger than the checkboxes of all the times that they have selected.
- Status title is big and visible so that user knows for sure and it is big because it is important.
- Below the "Status", the confirmed date and time is displayed in **bold**.
- Color scheme used throughout is the same as all other pages.

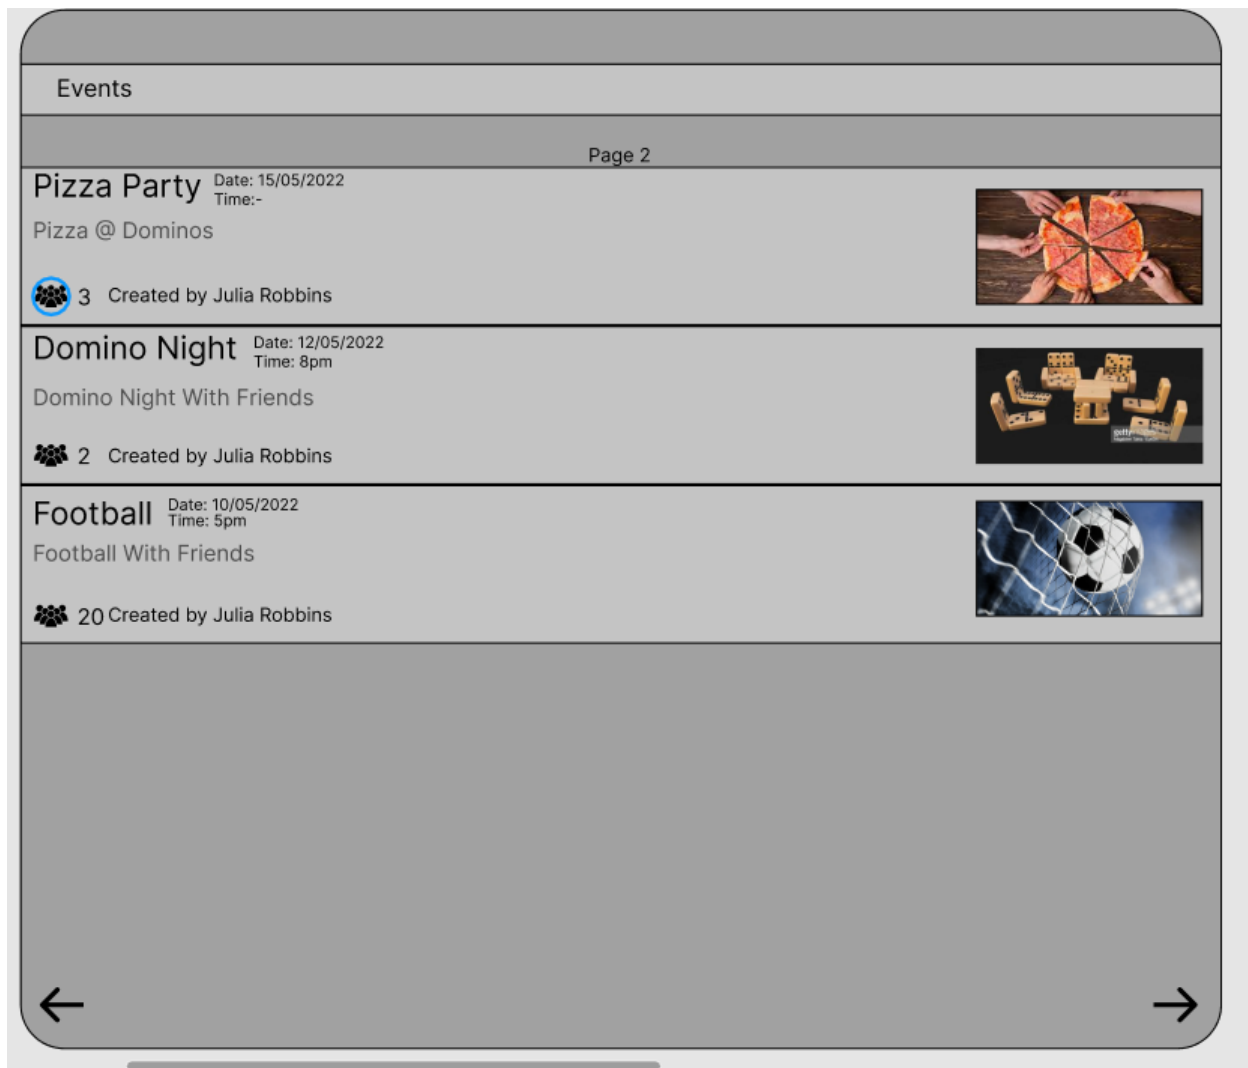

- Settings page with the top title being “Settings” and in a big font size
- Below settings is the user’s selected profile picture which they can change
- Below the picture are flex box rows will display the user’s information as the placeholder (not done in the design above).
- Below are the email notifications section. The title for it is bigger than the checkbox areas because user should know what the checkboxes are for clearly.
- MISSING IN IMAGE ABOVE: There will be a “Save Changes” oblong button at the bottom middle of the “Email Notifications”. Color of text will be in white with a dark shade of gray as a background for the button
- The mobile version of this page will be the same as the image shown above but with the menu side bar at the top left, as shown on page 4 of this document, which will either hide or bring out the navigation bar.

- If a user logged in as an Admin at the start, this is what they will be redirected to
- Their name is in the middle top of the page with their Admin status role on the right of their name. Font size is reasonable according to the page and there is not much to compare this font-size with so use font-size that makes it comfortably sit in the middle of the page.
- Oblong buttons are below this, with reasonable margin between them. Writing within the button is in black with the background of the button (behind the writing) is in a lighter shade of gray compared to the webpage displayed. Everything is clear and visible to see for the admin and everything is in the middle of the page with nothing else on the sides of the same height of these buttons, hence reducing cognitive load.
- All of these buttons and items in the middle of the page are in a container that has padding around it to equally space these items out between themselves and from the sides of the browser so that it stays consistent.
- Back button on the bottom left. Button is in black.

- Edit users page for Admin
- List of all the users. Search bar at the top left (may be removed) with a lighter shade of gray.
- Below the search bar, in the middle admin will see what page number they're on and below the page number, the users are displayed with their names in a good enough font-size to be clearly visible. The names will be to the left with a little bit of margin to the left of the names
- To the right will be oblong buttons that say "Edit" with a darker shade of gray background compared to the Users' row background.
- Bottom of the page has back and forward arrow buttons on the left and right of the page.

- Edit events page for the Admin. Pretty much a copy of the Events page for users but the admin can see all events from different users and can edit them.
- Editing page will be the same as the Creator Edit Event page.
- Edit Users page for admin will be the same as the Settings page for a specific user.
- Both of these pages will be technically the same the only real difference in terms of layout is that there is no navigation bar.
